Name of Student:Husam Nour	**PRN:25070122086**
Semester: III	**Year : AY 2026-27**
Subject: Programming with Java	
ASSIGNMENT No : 29	
TITLE : Write a JSP application to demonstrate the basic concepts of Java Server Pages.	

Problem Statement

Write a JSP application to demonstrate the basic concepts of Java Server Pages.

Learning Objectives

To understand the basic concepts of JSP and develop a simple JSP application for generating dynamic web content.

Theory:

Java Server Pages (JSP) is a server-side technology used for developing dynamic web applications. JSP allows Java code to be embedded within HTML pages using special JSP tags. When a JSP page is requested, the web server automatically translates it into a servlet, compiles it, and executes it to generate dynamic web content. JSP supports implicit objects, directives, scripting elements, expression language, and standard tag libraries. It simplifies web development by separating presentation from business logic. JSP is commonly used with Servlets and JDBC for building database-driven web applications.

1. Create a JSP page to display student informa on entered by the user

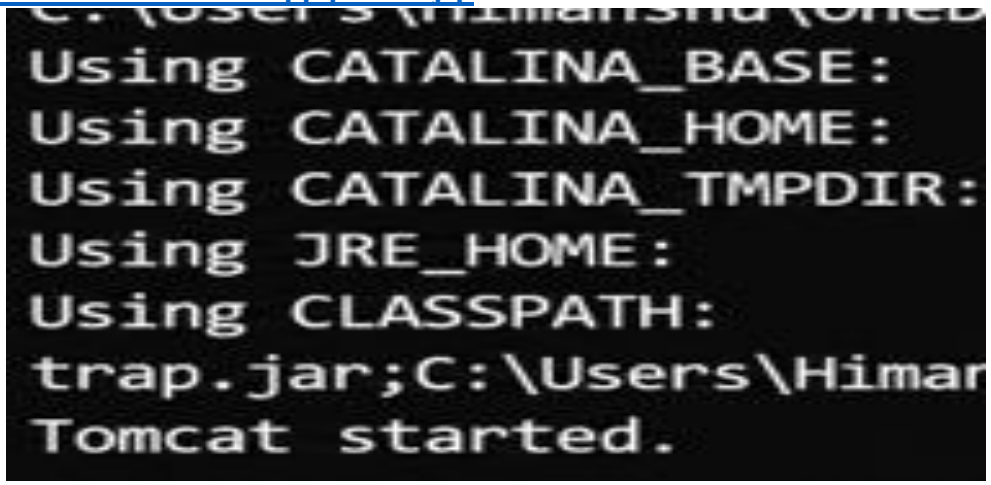

Programme:

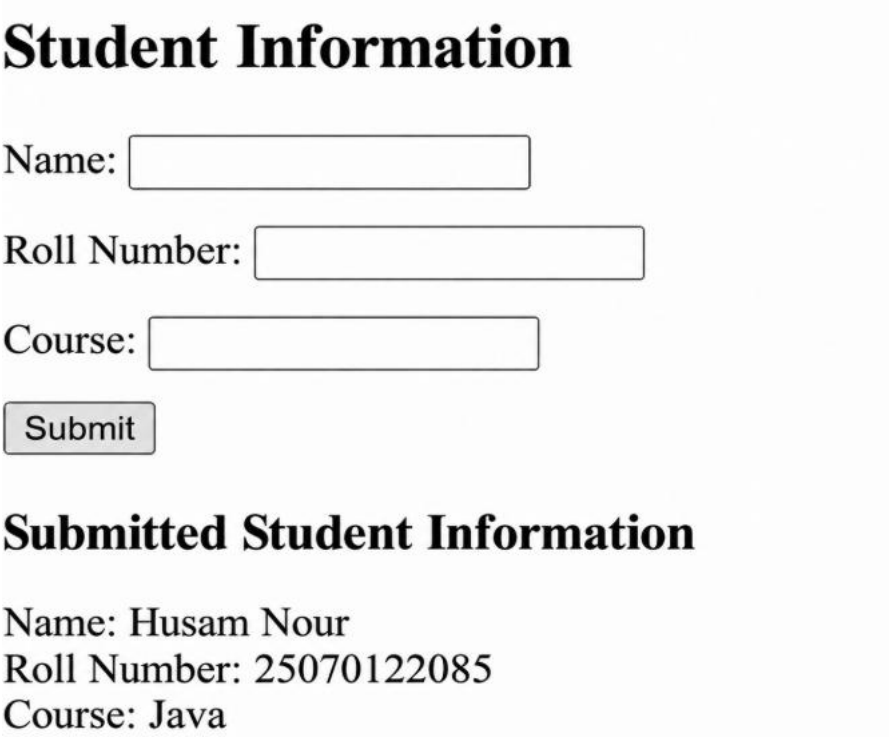

```
<!DOCTYPE html>
<html>
<head>
<title>Student Information</title>
</head>
<body>
<h2>Student Information</h2>
<form method="post">
Name:
<input type="text" name="name"><br><br>
Roll Number:
```

```
<input type="text" name="roll"><br><br> Course:
<input type="text" name="course"><br><br>
<input type="submit" value="Submit">
</form>
<%
String name = request.getParameter("name");
String roll = request.getParameter("roll"); String course =
request.getParameter("course"); if (name != null) {
%>
<h3>Submitted Student Information</h3>
Name: <%= name %><br>
Roll Number: <%= roll %><br>
Course: <%= course %><br>
<%
}
%>
</body>
</html>
```

Output:

http://localhost:8080/StudentApp/patient.jsp

2. Create a JSP application that takes user registration details such as Name, Email, Phone Number, and Password, and displays the submitted information on a result JSP page

Programme:

register.jsp

```
<!DOCTYPE html>
<html>
<head>
    <title>Registration Form</title>
</head>
<body>
    <h2>Student Registration Form</h2>
    <form action="result.jsp" method="post">
        Name:
        <input type="text" name="name"><br><br>
        Email:
```

```
        <input type="email" name="email"><br><br>
        Phone Number:
        <input type="text" name="phone"><br><br>
        Password:
        <input type="password" name="password"><br><br>
        <input type="submit" value="Register">
    </form>
</body>
</html>
```

result.jsp

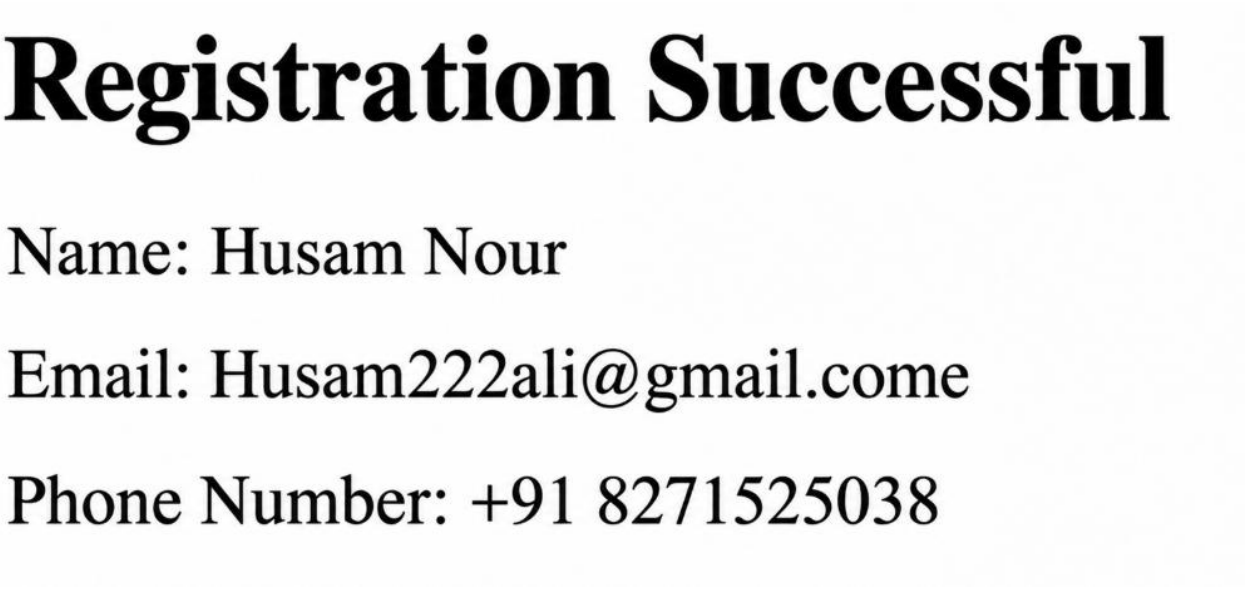

```
<!DOCTYPE html>
<html>
<head>
    <title>Registration Result</title>
</head>

<body>
    <h2>Registration Successful</h2>
<%
    String name = request.getParameter("name");
    String email = request.getParameter("email");
    String phone = request.getParameter("phone");
    String password = request.getParameter("password");
%>
    Name: <%= name %><br><br>
    Email: <%= email %><br><br>
    Phone Number: <%= phone %><br><br>
    Password: <%= password %><br><br>
</body>
```

</html>

Output: http://localhost:8080/StudentApp/

patient.jsp

Conclusion:

The JSP applications successfully demonstrate the basic concepts of Java Server Pages. The first exercise accepts and displays student information, while the second uses two JSP pages to accept registration details and display the submitted information on a result page.
